Automatically collected events are triggered by basic interactions with your app and/or site, such as clicking on links or filling out forms. As long as you use the Google tag or the Google Analytics for Firebase SDK, you don't need to write any additional code to collect these events. These events are helpful when accessing your raw event data in BigQuery. The names and parameters of these events can be useful when accessing your raw event data in BigQuery. To understand each event parameter listed below and how each parameter updates a dimension or metric in Google Analytics, see the documentation on Google Analytics event parameters. Note that some parameters are collected by default with every event, including custom events: Web stream: language page location page_referrer page_title screen_resolution App stream: app_version firebase_screen_id firebase_screen_class. The value assigned to event parameters must be 100 characters or fewer. The page_title parameter must be 300 characters or fewer. The page_referrer parameter must be 420 characters or fewer. The page_location parameter must be 1,000 characters or fewer. If you override the page_location parameter, make sure that the URL path is valid. You can use the Campaign URL Builder to check whether a URL path is valid. The firebase_screen_id and firebase_screen_class parameters are automatically collected unless you disable screenview tracking. Event Automatically triggered events include ad_click (app) when a user clicks an ad, publisher events coming from AdMob via the Google Mobile Ads SDK or Ad Manager via the Ad Manager integration. When the new version of the app launches, outbound click events will be triggered for all links leading away from the current domain. However, links to domains configured for cross-domain measurement will not trigger these events. The parameters that populate during this event include link_classes, link_domain, link_id, link_url, and outbound (boolean), as well as dynamic_link_app_open. For Android devices, when a user re-opens the app via a dynamic link, the event dynamic_link_app_update will be triggered. Note that Firebase Dynamic Links is currently deprecated, so this event is being phased out. As a result, source, medium, campaign, and accept_time parameters are not collected for this event. When a user opens the app for the first time via a dynamic link, the event dynamic_link_first_open is triggered. However, due to deprecation of Firebase Dynamic Links, this event is also being phased out. Its parameters include source, medium, campaign, and accept_time. In place of these deprecated events, error events can be used. These events provide additional information such as err (firebase error), ev (firebase error value), and el (firebase error length). However, these events do not appear in reports and are not exported to BigQuery. When a user clicks on a link leading to a file with a common file extension, such as document, text, executable, presentation, compressed file, video, or audio, the event file_download is triggered. This event is collected by default via enhanced measurement and includes parameters like file_extension, file_name, and link_classes. Firebase campaigns are also triggered when an app is launched with campaign parameters. These parameters include source, medium, campaign, term, content, gclid, acldid, cp1, and click_timestamp, and campaign_info_source. For iOS devices, Firebase In-App Message actions can be tracked using the event fiam_action (Android), while Android events use the notation firebase_in_app_message_action. When a user takes action on a Firebase In-App Message, the message_name, message_device_time, message_id parameters are collected. Similarly, when a user dismisses or sees a Firebase In-App Message, the corresponding events are triggered: fiam_dismiss and fiam_impression for Android devices, while firebase_in_app_message_dismiss and firebase_in_app_message_impression are used on iOS. When a user first launches an app after installing or re-installing it, the event first_open is triggered. However, this event does not appear in reports when the app was downloaded onto a device instead of being first used. For users who accept Apple's iOS 14 app-tracking prompt, first_visit events can be tracked for Android instant apps and websites with Analytics enabled. These parameters include client_id, ga_session_id, ga_session_number, ignore_referrer, page_location, page_referrer, and page_title. When a notification sent by FCM is received, an event triggers. This notification occurs when the app is in the background for Android only message_name, message_time, message_device_time, message_id, topic, label, message_channel, message_type os_update (app) happens on device update and previous os version is passed as a parameter. Also, each time a page loads or history changes by active site. Collected by default via enhanced measurement. page_location (page URL), page_referrer (previous page URL), engagement_time_msec screen_view (app) is triggered for screen transition when meets criteria: No screen was previously set The new screen name differs from the previous screen name The new screen-class name differs from the previous screen-class name The new screen id differs from the previous screen id firebase_screen, firebase_screen_class, firebase_screen_id, firebase_previous_screen, firebase_previous_class, firebase_previous_id, engagement_time_msec scroll (web) on first page reach bottom of each user reaches 90% vertical depth visible Collected by default via enhanced measurement. engagement_time_msec session_start (app, web) for app or website engagements A session ID and session number are generated automatically with each session associated with event in the session Learn more client_id, ga_session_id, ga_session_number, ignore_referrer, page_location, page_referrer, page_title, traffic_type user_engagement (app, web) is triggered when app in foreground webpage focus at least one second. Learn more engagement_time_msec video_complete (web) when video ends For embedded YouTube videos with JS API support enabled Collected by default via enhanced measurement. video_current_time, video_duration, video_percent, video_provider, video_title, video_url, visible (boolean) video_progress (web) when progress past 10%, 25%, 50%, and 75% duration time For embedded YouTube videos with JS API support enabled Collected by default via enhanced measurement. video_current_time, video_duration, video_percent, video_provider, video_title, video_url, visible (boolean) view_search_results (web) each time user performs site search indicated by URL query parameter Collected by default via enhanced measurement. search_term, optionally q_ (where matches additional query parameter specified under advanced settings) Note: File extensions matching regex will trigger file_download event pdf|xls|xlsx?|docx?|txt|rtf|csv|exe|key|ppt|s|t|tx|j|7z|pkg|rar|gz|zip|avi|mov|mp4|mpe|g|wmv|midi?|mp3|wav|wma
